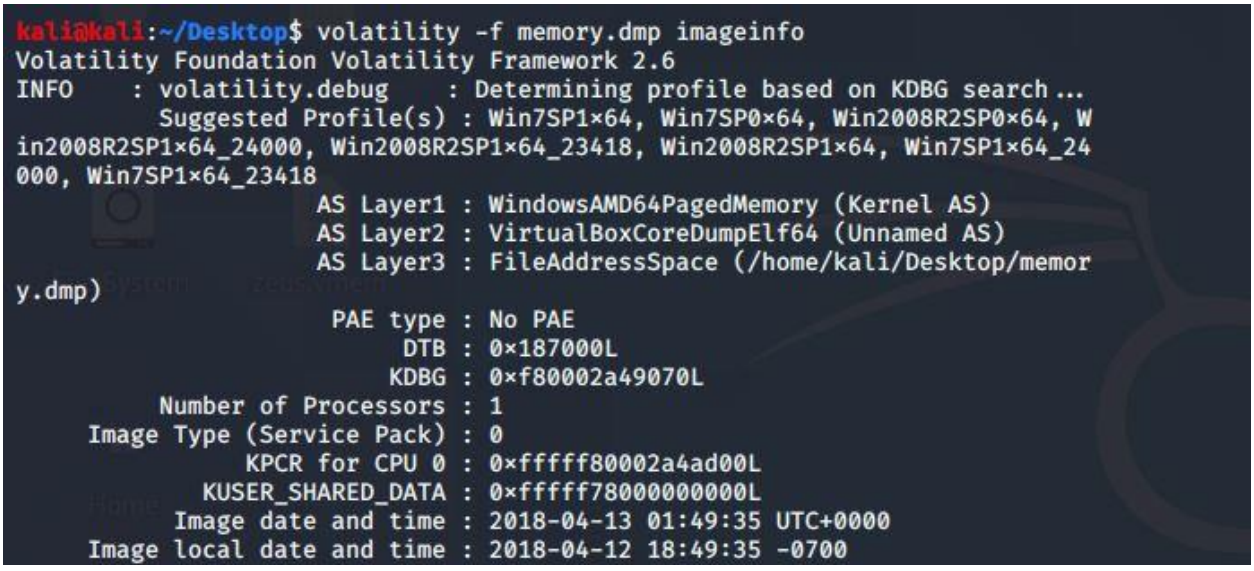
1- Identify running processes, and determine which ones look suspicious and justify why?

At very first step to find what operating system this memory image belongs to and find memory profile on suspected memory we run volatility and use the command:

volatility -f memory.dmp imageinfo



From the result of this command we have service pack 0 so our suggested profile is Win7SP0x64 .

We now have the computer OS from which this memory dump comes from (Win7SP0x64). The investigation can now begin, we can specify to volatility the OS profile (--profile=Win7SP0x64) and try to find what happened on the victim's computer

To determine the processes were running on the system at the time of capturing the memory image we use pslist, and pstree command as follow:

University of Victoria

volatility -f memory.dmp --profile=Win7SP0x64 pstree

volatility -f memory.dmp --profile=Win7SP0x64 pslist

```
kali@kali:~/Desktop$ volatility -f memory.dmp --profile=Win7SP0x64 pslist

```

An alternative to the pslist plugin, we used to display the processes and their parent processes is **pstree.**

University of Victoria

```

So, based on results of pstree we can find more details and a lot of information about the behavior of processes.

By running **psscan** and **psxview** , we do more investigation.**psxview** will list processes that are trying to hide themselves while running on the computer, if we see “False” in the first two columns (**pslist** and **psscan**).

Volatility -f memory.dmp --profile=Win7SP0x64 psxview

```

In our scenario, the last four processes of psxview are a little complicatable. **Psxview** shows that there is some unlinked process which is listed in psscan but not in pslist like PID992,PID1964,PID2364.

By running **netscan** we have found more information to see possibilility of open ports and network connections.

Volatility -f memory.dmp --profile=Win7SP0x64 netscan

0×3e5cd630	TCPv6	:::49153	:::0	LISTENING	824	svchost.exe	

Result from netscan is a good thing to do is to check the running sockets and open connections on the computer.

Then we used the command **cmdline** plugin which displays process command-line arguments.this gave us interesting information about the directory of executed processes on the system.

Volatility -f memory.dmp --profile=Win7SP0x64 cmdline

```

After doing more analysis on above results we found some of these process seem to be legitimate but some of them look more malicious as follow :

By Comparison between cmdline (Display process command-line arguments) and pstree (Print process list as a tree) we can see that:

```
kali@kali:~/Desktop$ volatility -f memory.dmp --profile=Win7SP0x64 pstree

.. 0×fffffa8000e2fb30:mscorsvw.exe	3056	488	7	86	2018-04-13 01:28:40 UTC+0000

. In this case **svchost.exe** with **PID is 1404** created by **PPID 448**

As we can see that **448** is the **PID of services.exe.** However**, services.exe** is a child of **wininit.exe.**

Our machine in this project is **WIN7SP0x64** and we know that in windows vista and later all windows have this process. So, it seems that it is OK

But we know that **Svchost.exe** is a process on the computer that hosts, or contains, other individual services that Windows uses to perform various functions. For example, **Windows Defender** and **Windows Update** use a service that is hosted by a svchost.exe process. The file often connects to www.windowsupdate.microsoft.com by either visiting the **Microsoft Update website**, **Microsoft Windows Update website**, or through automatic updating without a browser. "svchost.exe" is the host processor that manages the group of update service DLLs in the database from the Windows User Automatic Updates Server (WUAUSERV).

When we check **svcscan,** we use this command to scan for Windows services. All process that run on windows services are shown with this command. So based on this result, the PID 1404 is windows services.

Volatility -f memory.dmp --profile=Win7SP0x64 svcscan

```
kali@kali:~/Desktop$
kali@kali:~/Desktop$ volatility -f memory.dmp --profile=Win7SP0x64 svcscan
```

```
Offset: 0x98cb10
Order: 368
Start: SERVICE_AUTO_START
Process ID: 1404
Service Name: WinDefend
Display Name: Windows Defender
Service Type: SERVICE_WIN32_SHARE_PROCESS
Service State: SERVICE_RUNNING
Binary Path: C:\Windows\System32\svchost.exe -k secsvcs
```

With malfind command we prove that 1404 is suspicious.

```
kali@kali:~/Desktop$ volatility -f memory.dmp --profile=Win7SP0x64 malfind -p 1404

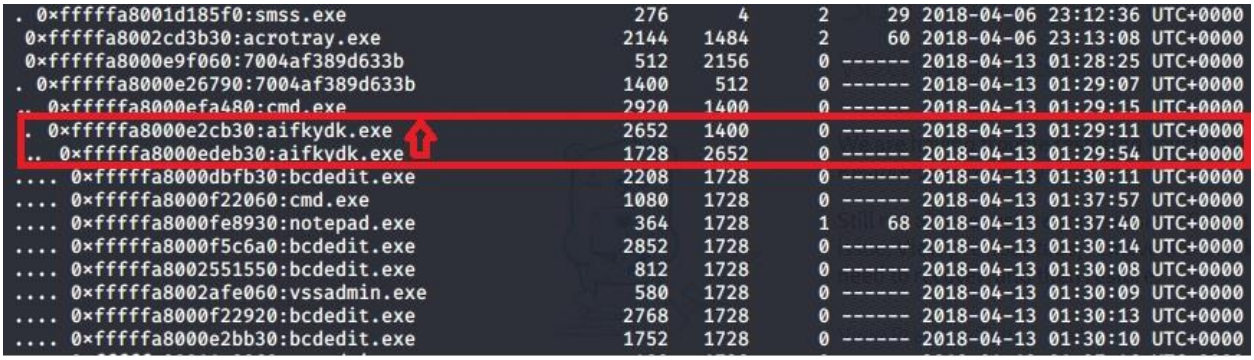
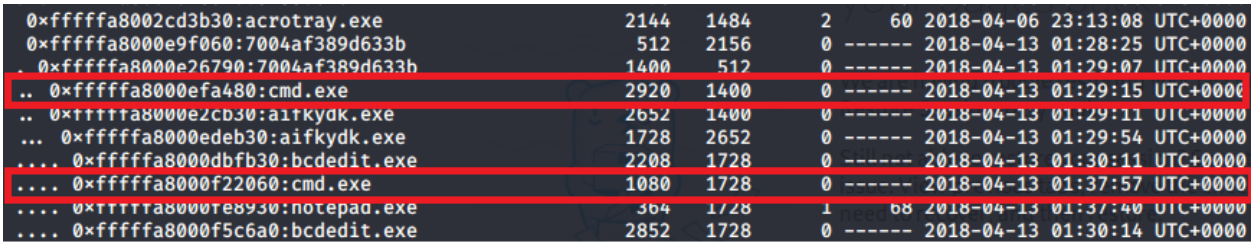
Another process **aifkydk.exe**

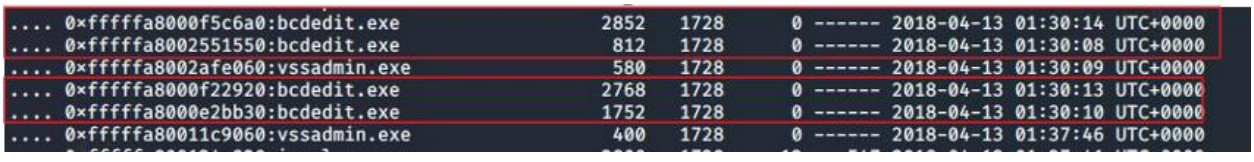


This is suspicious because the parent of **aifkydk.exe** with 2652 as a process ID, the parent's ID of this process is 1728. As highlighted with the red box in the above picture we can see that both processes have the same process name but different process ID and different parents ID. Second one was not started by winlogon.exe or wininit.exe but these processes were started by unknown aifkydk.exe .



In the above screen shot **cmd.exe** the process id is 2920 with parents ID of 1400.
1400 is the PID of a process that is unknown. This process parent ID is 512. and again 512 is an unknown process. So, cmd.exe in this case is suspicious.

In the second red highlighted box, **cmd.exe** with process ID of 1080 seems suspicious.
Because of the PPID of this process in 1728.
According to the above description, the process with this ID is suspicious.



bcdedit.exe is an executable file that is part of **Windows 10 Operating System** developed by **Microsoft Corporation**. In some cases, executable files can damage the computer.

Four process IDs for **bcdedit.exe** have the same PPID including ; 2852, 812, 2768, and 1752. and it is another suspicious. All processes come from the same PPID and these are suspicious.

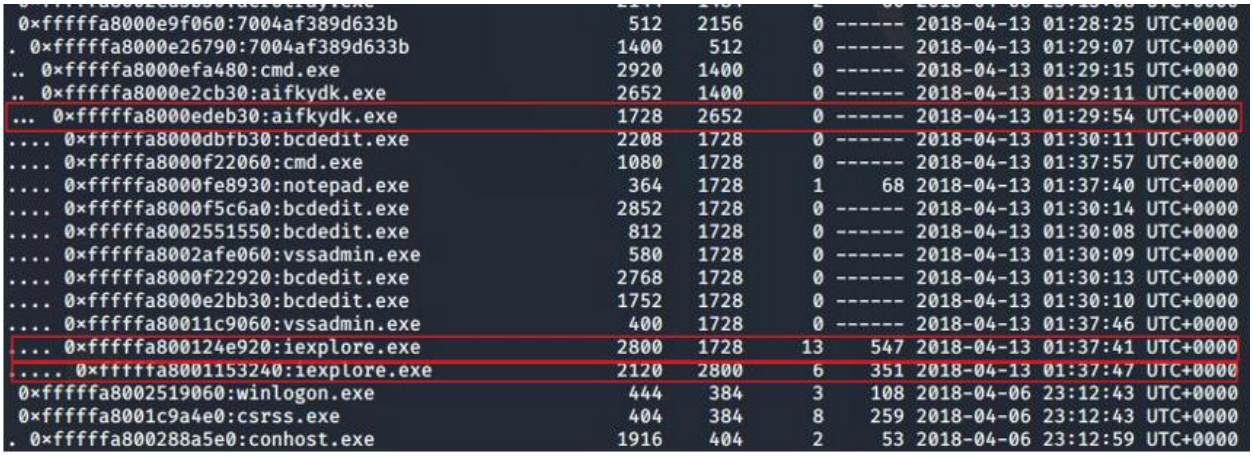
Notepad.exe with PID 364. In this case 364 is the PPID of 1728. And also 1728 is the PID of aifkydk.exe .it seems suspicious and in the previous page IN AIFKYDK part explain in detail.



0×fffffa8000e9f060:7004af389d633b	512	2156	0	------	2018-04-13 01:28:25	UTC+0000

According to comparison between cmdline and pstree command result

Iexplorer.exe with a PID of 2800 . It is clear that PPID=1728 of this process is aifkydk.exe. And we know that this process PPID of an unknown process. So. it seems this process is suspicious, too.

IExplore.exe with PID 2120 has a PPID of 2800. 2800 is the same process name with different PPID. And also, when we use **svcscan** command. we can
Scan for Windows services. However, we cannot find Iexplore.exe with PPID 2120 in **svcscan** logs. So the information proves that this process is suspicious.

The Malfind for iexplore.exe on PID of 2120 we can find useful information.

```
Process: iexplore.exe Pid: 2120 Address: 0×120000
Vad Tag: VadS Protection: PAGE_EXECUTE_READWRITE
Flags: CommitCharge: 1, MemCommit: 1, PrivateMemory: 1, Protection: 6
```

Malifind for iexoplore.exe on PID 2800

```
Process: iexplore.exe Pid: 2800 Address: 0×2820000
Vad Tag: VadS Protection: PAGE_EXECUTE_READWRITE
Flags: CommitCharge: 2, MemCommit: 1, PrivateMemory: 1, Protection: 6

0×02820000  b0 00 eb 70 b0 01 eb 6c b0 02 eb 68 b0 03 eb 64    ...p...l...h...d
0×02820010  b0 04 eb 60 b0 05 eb 5c b0 06 eb 58 b0 07 eb 54    ...`...\...X...T
0×02820020  b0 08 eb 50 b0 09 eb 4c b0 0a eb 48 b0 0b eb 44    ...P...L...H...D
0×02820030  b0 0c eb 40 b0 0d eb 3c b0 0e eb 38 b0 0f eb 34    ...@...<...8...4
```

Those screenshots lead to determining more specifically. In this case, 2120 is malicious. The explorer.exe is executing protection which indicates the process is malicious. In the process of checking the malfind log.

According to pstree logs and more information in pslist and cmdline. It shows that:

```
kali@kali:~/Desktop$ volatility -f memory.dmp --profile=Win7SP0×64 pstree

```

mscorsvw.exe is a legitimate file from Microsoft Corporation that is used for running .NET programs. It precompiled .NET assemblies in the background. It is commonly located in c:\windows\microsoft.NET\framework.
But in this case when we use **cmdline** we can find another folder as a location of mscorsvw.exe

```
**************************************************************************
mscorsvw.exe pid:   2740
Command line : C:\Windows\Microsoft.NET\Framework\v2.0.50727\mscorsvw.exe
**************************************************************************
mscorsvw.exe pid:   3056
Command line : C:\Windows\Microsoft.NET\Framework64\v2.0.50727\mscorsvw.exe
**************************************************************************
```

```
**********************************************************************
mscorsvw.exe pid:   2728
Command line : C:\Windows\Microsoft.NET\Framework\v2.0.50727\mscorsvw.exe -UseCLSID {170EFAC6-D812-4C86-B1B5-9BC8570FD482} -Comment "Compile worker for ehiVidCtl, Version=6.1.0.0, Culture=neutral, PublicKeyToken=31bf3856ad364e35"
```

Both PID 2740 and 3056 in the first picture are the same PPID. Their PPID is 448. But in **cmdline** result it's obviously that both processes are located in different directories. Although they have the same PPID and same process name.

Surprisingly, mscorsw.exe with PPID of 2728 is malicious. It does not have a weird directory in **cmdline.** It can be shown in the above picture. PPID of 2728 is 2740. It can be seen that two different PID for the same PPID = 448 with the same name show that this process is suspicious.

In another browsing malicious process we can find **vssadmin.exe**

```
.... 0×fffffa80011c9060:vssadmin.exe          400   1728      0 ------ 2018-04-13 01:37:46 UTC+0000
..... 0×fffffa8001153240:iexplore.exe        2120   2800      6    351 2018-04-13 01:37:47 UTC+0000
```

This file is a command-line tool made available to interface with the “Volume Shadow Copy Service”. But many times all ransomware will use **vssadmin.exe** to delete “shadow copies” of files, which we probably didn’t even know we had, before encrypting the files we do know about. So, it seems that this file is suspicious.

According to the pstree result, **python.exe** is suspicious.

```
 0×fffffa8002ab6b30:explorer.exe              1652   1580     23    817 2018-04-06 23:12:51 UTC+0000
. 0×fffffa8002618060:python.exe               1208   1652      1     92 2018-04-06 23:12:59 UTC+0000
.. 0×fffffa8002a83950:python.exe              2176   1208     16    233 2018-04-13 01:28:34 UTC+0000
. 0×fffffa8002e82520:SndVol.exe               2568   1652      0 ------ 2018-04-06 23:13:23 UTC+0000
```

Python.exe with process ID 1208 that parents ID of another Python.exe process.
1652 is the PPID of python.exe and also, the PID of explorer.exe
It seems that this is suspicious.

According to **cmdline** information and also **netscan** information we can find that:

```
**********************************************************************
python.exe pid:   1208
Command line : "C:\Python27\python.exe" "C:\Users\Win7\AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup\agent.py"
**********************************************************************
```

But

When we look for python.exe in **netscan** we find a lot of information.

0×3e38f9a0	TCPv4	192.168.50.11:49603	192.168.50.1:2042	CLOSED	2176	python.exe

Note: Like TCP (Transmission Control **Protocol**), UDP is used with IP (the Internet **Protocol**) but unlike TCP on Port 8000, UDP Port 8000 is connectionless and does not guarantee reliable communication; it's up to the application that received the message on Port 8000 to process any errors and verify correct delivery.

After **python.exe** is closed on port 8000 on TCP, another **python.exe** with different PID that is 2176 is coming to Established. Two processes with the same name and different PID and also different treatment in **netscan** show that this process is malicious.

Moreover, **FIN_WAIT_2** in **netscan** seems to occur when the server has an active connection with a client and wants to shut down the TCP connection. The server sends the client a packet with a "FIN" bit set. At this point, the server is in FIN_WAIT_1 state. The client gets the FIN packet and goes into CLOSE_WAIT state, and sends an acknowledgment packet back to the server. When the server gets that packet, it goes into FIN_WAIT_2 state. From the server's perspective, the connection is now closed, and the server can't send any more data. However, under the TCP protocol, the client needs to shut down also by sending a FIN packet, which the server TCP implementation should ACK. The server should close after a period of time defined by the Maximum Segment Lifetime.

```

Another information that we can find from the above screenshots are:

The process **acrotray.exe** with PID 2144 and parent ID 1484 is associated with Adobe Acrobat. If it has another word after the name acrotray.exe it seems that suspicious.
According to **cmdline** logs, this process location is OK.

```
acrotray.exe pid:   2144
Command line : "C:\Program Files (x86)\Adobe\Acrobat 10.0\Acrobat\acrotray.exe"
```

The process with the PID 1932 is **dllhost.exe** under parent ID 612 needs more investigation. This PID 1932 started 7 days after its parent starting time, svchost.exe.
According to **cmdline** logs, we can find a little abnormal thing in the description of this file.

```
dllhost.exe pid:   1932
Command line : C:\Windows\SysWOW64\DllHost.exe /Processid:{76D0CB12-7604-4048-B83C-1005C7DDC503}
```

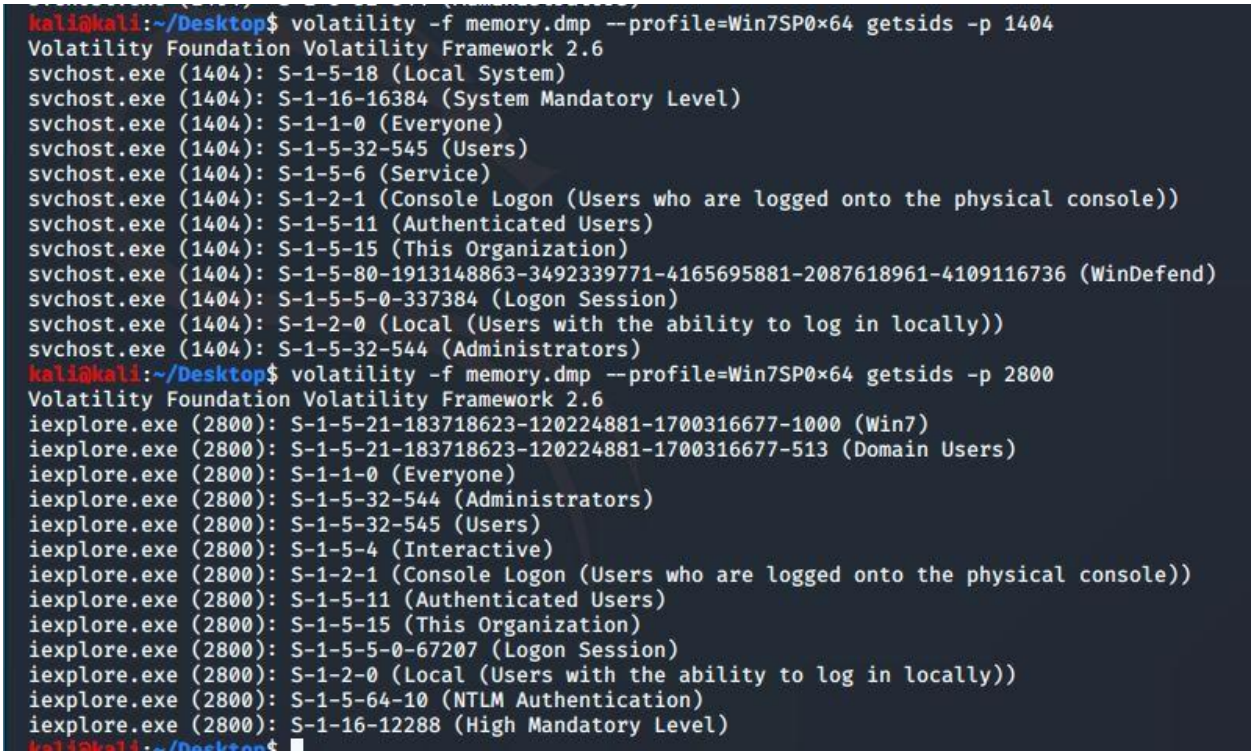
The process with the PID 352 is **winit.exe** and PID 360 **cress.exe** have same PPID 352 with no more information about this ID, we know that for some process like **Winint .exe**, **cress.exe** and **explorer exe** which are created by an instance of **smss.exe** and sometimes analysis tools not show their parent ID.

```
.... 0xfffffa80011c9060:vssadmin.exe           400   1728      0 ------ 2018-04-13 01:37:46 UTC+0000
.... 0xfffffa800124e920:iexplore.exe          2800   1728     13    547 2018-04-13 01:37:41 UTC+0000
..... 0xfffffa8001153240:iexplore.exe         2120   2800      6    351 2018-04-13 01:37:47 UTC+0000
 0xfffffa8002519060:winlogon.exe               444    384      3    108 2018-04-06 23:12:43 UTC+0000
 0xfffffa8001c9a4e0:csrss.exe                  404    384      8    259 2018-04-06 23:12:43 UTC+0000
. 0xfffffa800288a5e0:conhost.exe              1916    404      2     53 2018-04-06 23:12:59 UTC+0000
```

The process with the PID 360 is **csrss.exe** with PPID 352 and then we PID 404 **csrss.exe** same name but with different parent ID 384, and for both these PPID there is no more information.

The process with the PID 276 with parent ID 4 is **smss.exe** started exactly at the same time as its parent 4,**system.exe**. Maybe we can do more consideration about this process too.

We tried command **getsids** for some of our suspicious processes such as PID 1404,2120,280,512. **Getsids** give us ideas about malicious escalated privileges.



```

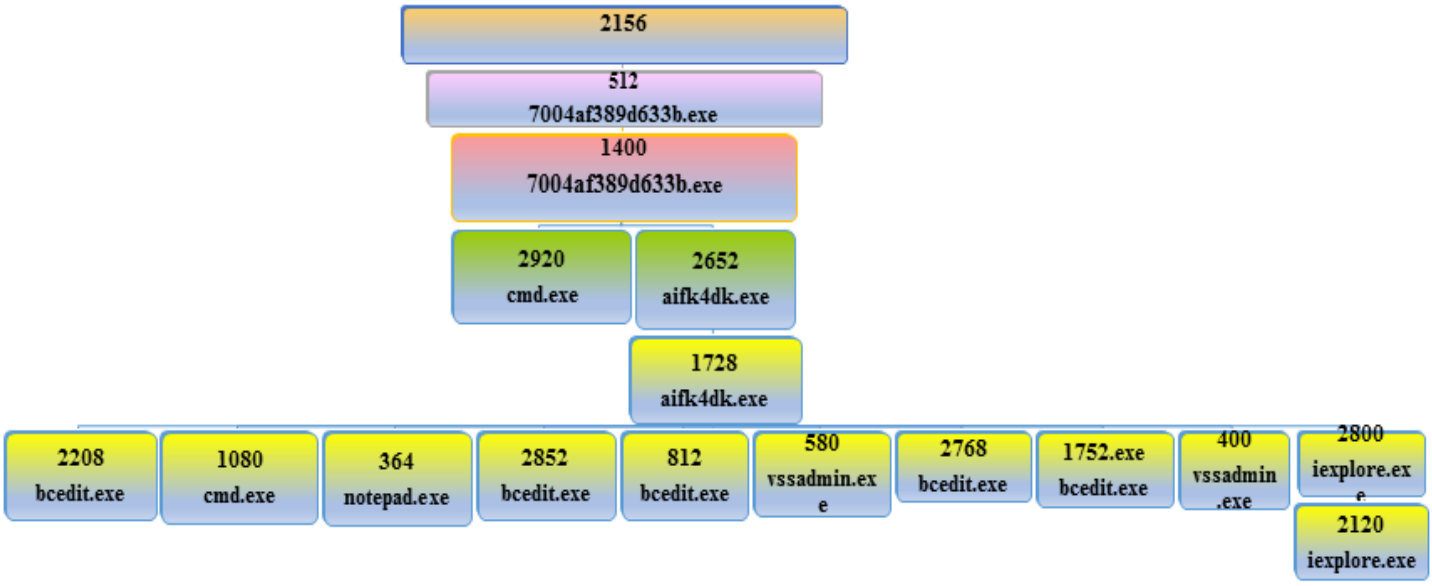
2. Determine and explain the relationships (i.e., parent-child) between the suspicious processes identified above. Identify which process is most likely responsible for the initial exploit.

For this part we have two analyses. One of them is based on pstree, pslist, and cmdline and the other one focuses on **netscan** log.

Based on malicious processes and suspected processes which have been found above. And by considering **pslist** and **pstree** we see hierarchical of these processes under **winit.exe** and the system looks fine. But as we see we have PID 512, 7004af389d633b, which is an unknown process and it is a child of process ID 2156, which is unknown without any more information about its initial baseline. following hierarchical diagram shows that PID 2120, iexplore.exe is child of PID 2800, iexplore.exe. and then all PIDs 2800,400,1752,2768,580, 812,2852,364,1080,2208 are child of parent process ID 1728, **aifkydk.exe** which is unknown process. Then PID 1728 is child of process ID 2652, **aifkydk**. Both these child and parent processes have the same name with different starting time about 43seconds. Then process 2652 with process 2920 both are child of parent process 1400, 7004af389d633b. process ID 1400 is a child of process 512, 7004af389d633b which have the same name and unknown name. at the end PID 512 is a child of parent process 2152 which is completely unknown without any more information about its initial baseline. So looks these processes 2156 and its child PID 512 are most likely responsible for initial and their child's are suspected.

And if we look at the starting time of other suspected processes which we notified in question 1, like PID 1404 SVChost.exe and PID 2176 started a few seconds after initial PID 512.



Hierarchical diagram

Also, according to the incident overview, and the whole information above in the first question, First of all, **svchost.exe is always** using **port** 53. According to information from **netscan**, **pstree** and **cmdine**.
Specifically, in **netscan** the svchost.exe tries to login to the machine several times with different ports. But it cannot. Surprisingly, svchost.exe with PID 1296 is malicious.
In **pstree**, **pslist, svcscan, cmdline, malfind** we cannot find any information about 1296.

Svchost.exe in this scenario is listening to the port and then closes when python.exe will come.

Volatility Foundation Volatility Framework 2.6

Offset(P)	Proto	Local Address	Foreign Address	State	Pid	Owner	Created

0×3de1c9c0	UDPv6	fe80::c0c9:aa19:31b7:43c6:64671	*:*		1296	svchost.exe	2018-04-13 01:28:34 UTC+0000
0×3de22730	UDPv6	::1:1900	*:*		1296	svchost.exe	2018-04-13 01:28:34 UTC+0000

Svshost.exe with PID of 1296 is **local service (no impersonation).** "To exploit these vulnerabilities, the attacker would first need to identify systems running vulnerable UPnP services. UPnP makes this easy by providing a discovery service over **UDP port 1900. In Netscan svchost.exe with PID 1296 is on port UDP 1900.**

Python.exe's port number is 49598 on TCP . Whenever the system changes the process ID of python.exe to 2176. It is obvious that attackers use python in several ports. It is worth noting that python 1276 has a Parent PID 1208 (python.exe). And again the parent ID of this python is 1652. 1652 is PPID of two different processes and also unknown. So, python.exe with process ID 2176 can be one of the initial.

University of Victoria

3.From the above list of suspicious processes, identify at least one process with hidden or injected code/DLLs, and identify corresponding hidden DLLs

We select PID 1404 , PID 2120 From suspicious processes which discussed above. By using command malfind as follow:

For PID 2120:

volatility -f memory.dmp --profile=Win7SP0x64 malfind -p 2120

Fro PID 2120 ten memory segments were detected which start at 0x00120000,0x00080000, 0x00070000,0x00090000,0x001e0000,0x00210000 ,0x00230000,0x02510000, 0x029b0000 ,0x5fff0000. All of them are executable. It has Vad Tag (memory protection) as PAGE_EXECUTE_READAWRITE, and based on disassembly in the data in the address looks there is some injection and suspicious

here. Also by using dump-dir we could dump the binary that was injected into this process. As above image.

Also for the detection of injected and hidden dlls we compare the PEB(process environment block) and the VAD(Virtual address descriptor) structure by using the command ldrmodules as follow:

volatility -f memory.dmp --profile=Win7SP0x64 ldrmodules -p 2120

```
kali@kali:~/Desktop$ volatility -f memory.dmp --profile=Win7SP0x64 ldrmodules -p 2120

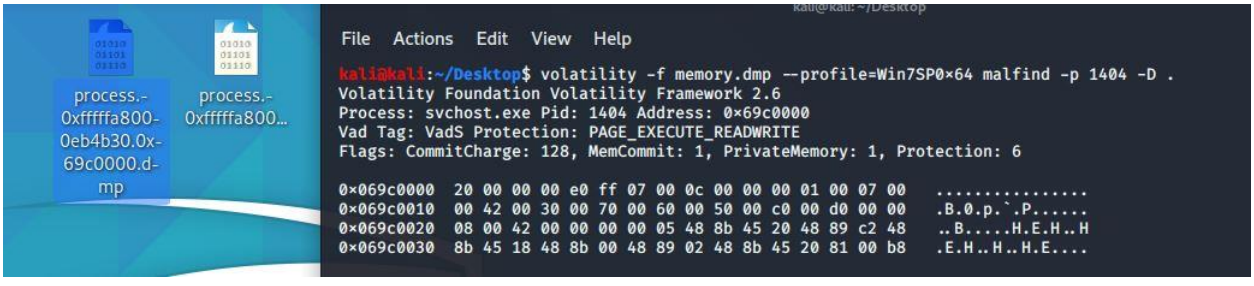
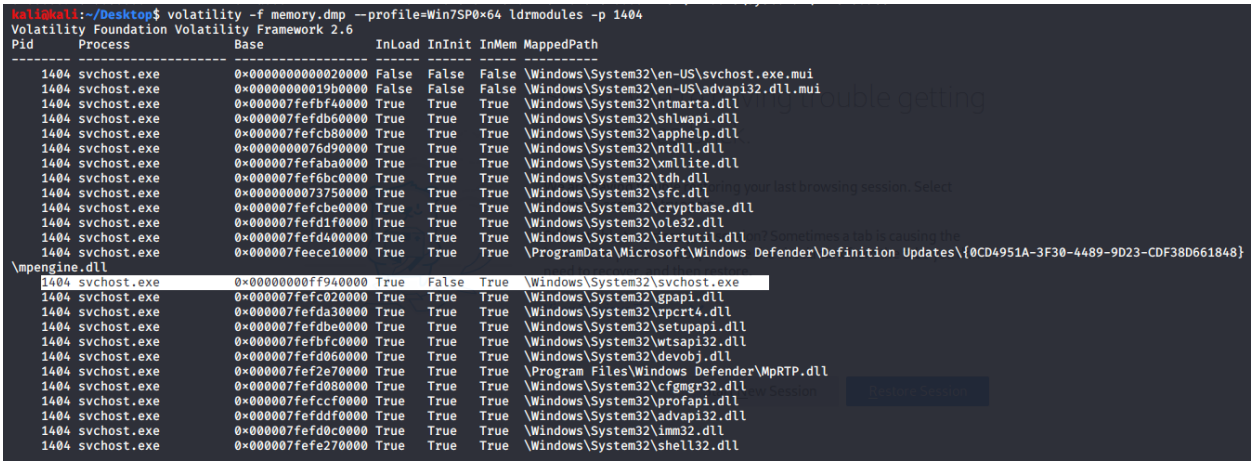
For PID 1404 two memory segments were detected, first memory segment starts at 0x069c000 and second at 0x06a4000. Both are executable. It has Vad Tag (memory protection) as PAGE_EXECUTE_READWRITE, and based on disassembly in the data in the address looks there is some injection and suspicious here. Also by using dump-dir as follow we could dump the binary that was injected into this process.



Also for the detection of injected and hidden dlls we compare the PEB(process environment block) and the VAD(Virtual address descriptor) structure by using the command **ldrmodules** as follow:

volatility -f memory.dmp --profile=Win7SP0x64 ldrmodules -p 1404



```

The PEB structure resides in the process memory and keeps tracks of the full path to the executable and its base address, whereas VAD structure resides in the kernel memory.Comparing these two structures for discrepancy can tell if a process is hollowed out. In the below screenshot running the dlllist plugin shows the full path to **svchosts.exe (pid 1404)** and the base address (**0x00000000ff940000**) where it is loaded. The dlllist plugin gets this information from the PEB.So, svchost.exe is malicious.

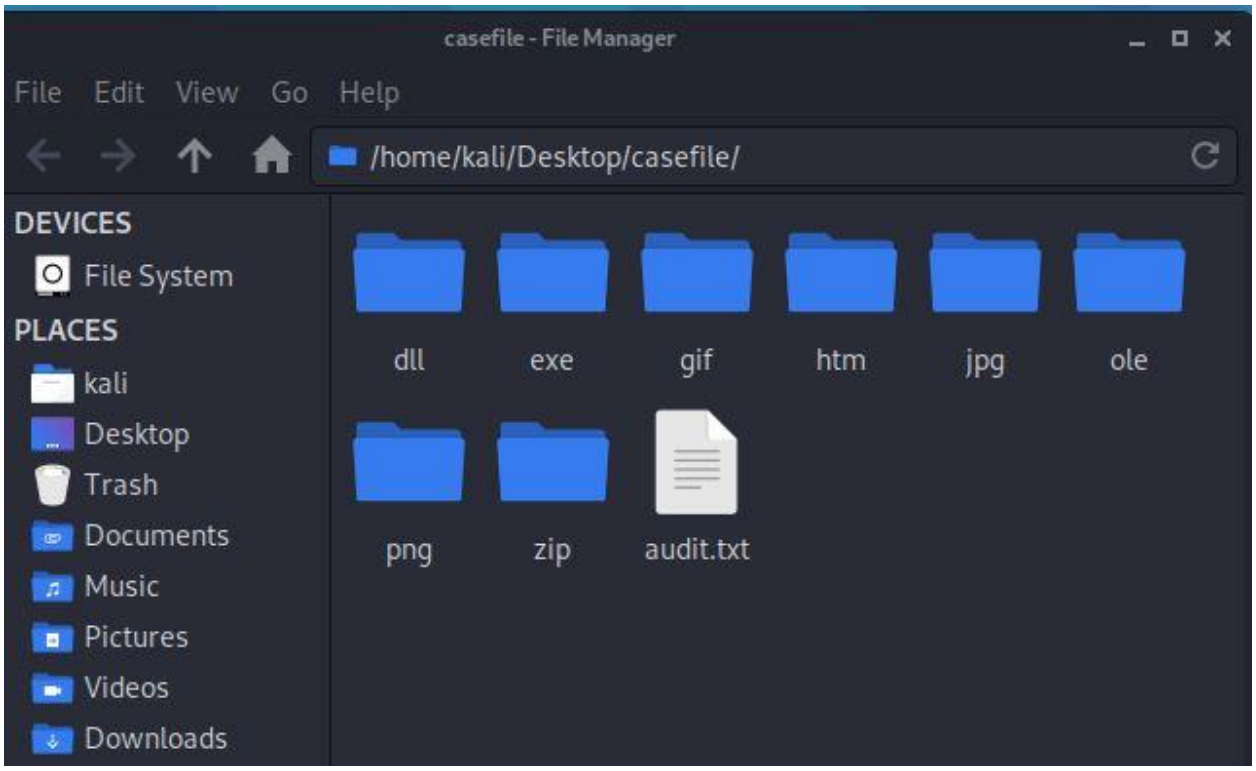
University of Victoria

4.Extract the executables for one of the suspicious processes identified above, and check whether at least one of these files is malicious using an online virus scanner [1%].

For this question we chose PID 2120 for analysis. In the first step we have dumped memory of that process by using command as:

volatility -f memory.dmp –profile=Win7SP0x64 memdump -p 2120–dump-dir .

By using foremost command exe files for scanning have been separated as follow:

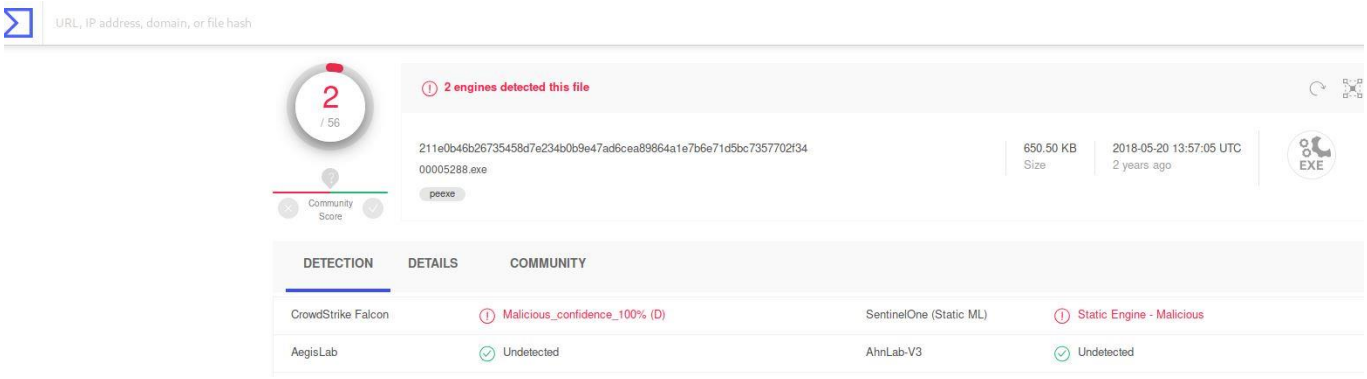


When we open audit.text file we see content of this dump.

```
127 FILES EXTRACTED

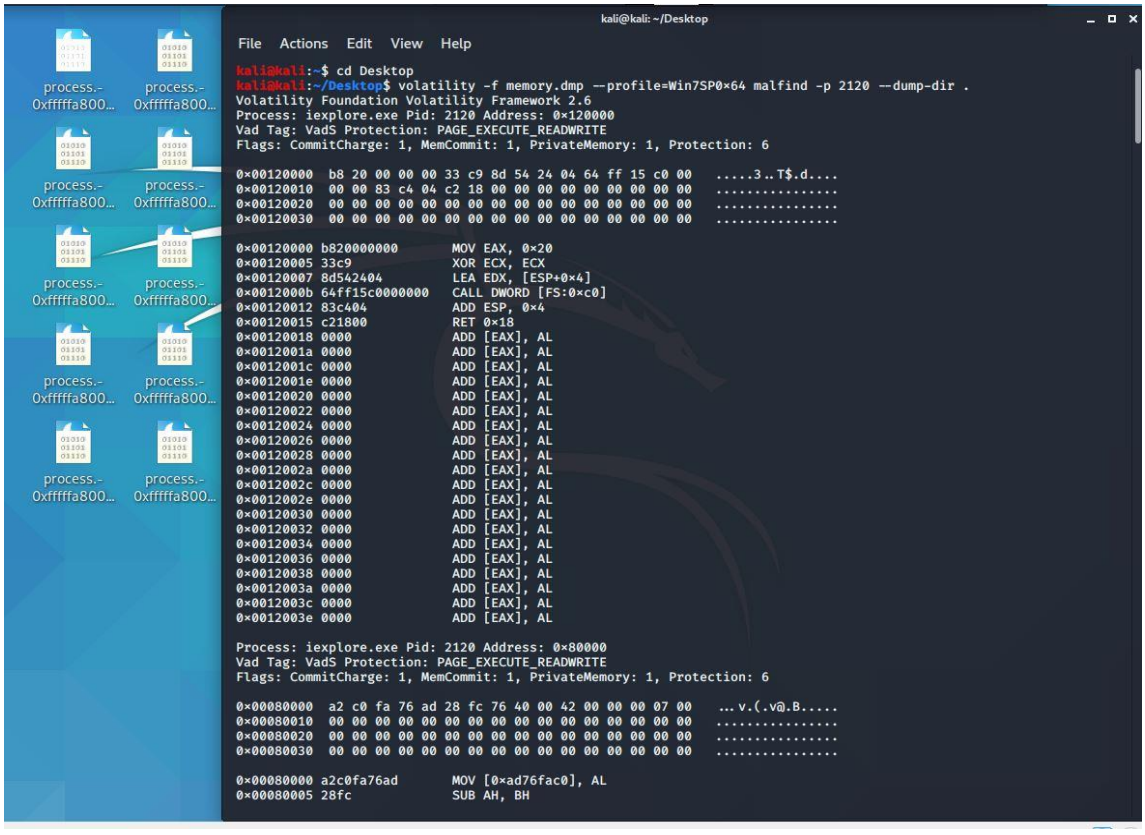
jpg:= 1
gif:= 6
htm:= 69
ole:= 1
zip:= 1
exe:= 34
png:= 15
------------------------------------------------------------------
```

By checking these files in Virus scanner, we see this process is malicious. We see that different information about kind of suspicious is provided too.



Also we used malfind command for PID 2120 and dump memory of this process as follow too :

Volatility -f memory.dmp –profile=Win7SP0x64 malfind 2120 –dump-dir .



As a result, we have 8 files that we create their hashes and gave it to virus scanner.

```
kali@kali:~/Desktop$ ls
 casefile   memdump   memory.dmp  'New Folder'   process.0×fffffa8000eb4b30.0×69c0000.dmp   process.0×fffffa8000eb4b30.0×6a40000.dmp
kali@kali:~/Desktop$ md5sum process.0×fffffa8000eb4b30.0×69c0000.dmp
890b36c3147d039dc64a66b988fc6a97  process.0×fffffa8000eb4b30.0×69c0000.dmp
kali@kali:~/Desktop$ md5sum  process.0×fffffa8000eb4b30.0×6a40000.dmp
23ad17ebb87c07135e196fe67213471f  process.0×fffffa8000eb4b30.0×6a40000.dmp
kali@kali:~/Desktop$
```

5.Identify the URLs (and a corresponding IP address) for one of the possible remote command and control servers visited by the malware. Confirm that the selected URL is malicious using an online scanner. Note: You can limit the search to the initial (suspicious) process that triggered the exploit, or any other relevant process

One samples are as a follows for **Iexplore.exe process ID 2120** is selected based on the question. As you can see that based on question 1 and 2, we found a lot of suspicious process.
We use this command for finding url:
First we create dmp file and then strings to find a url

volatility -f memory.dmp --profile=Win7SP0x64 -p 2120 memdump –dump-dir=dump

```
kali@kali:~/Desktop$ volatility -f  memory.dmp --profile=Win7SP0x64 -p 2120 memdump --dump-dir=dump
Volatility Foundation Volatility Framework 2.6
************************************************************************
Writing iexplore.exe [  2120] to 2120.dmp
```

Strings /home/kali/Desktop/dump/2120.dmp | grep “http://”

```
kali@kali:~/Desktop$ strings /home/kali/Desktop/dump/2120.dmp | grep "http://"
```

URLs list

List of any suspicious URLs that may be in the suspected process’s memory are as follows. All 8 pages that contain URLs of process ID 2120 are show as a follows:

```
kali@kali:~/Desktop$ strings /home/kali/Desktop/dump/2120.dmp | grep "http://"

The URL, we found related IP addresses. When we test URLs wit Virus scanner,virustotal.com and test to find an IP address based on URLs in IPvoid.com. We found some of these URLs are suspicious with different percentages. It means that different process with different result from different virus scanners.

We use nslookup to find an IP address of each URLs. Three URLs of process ID 2120 are as follows.

University of Victoria

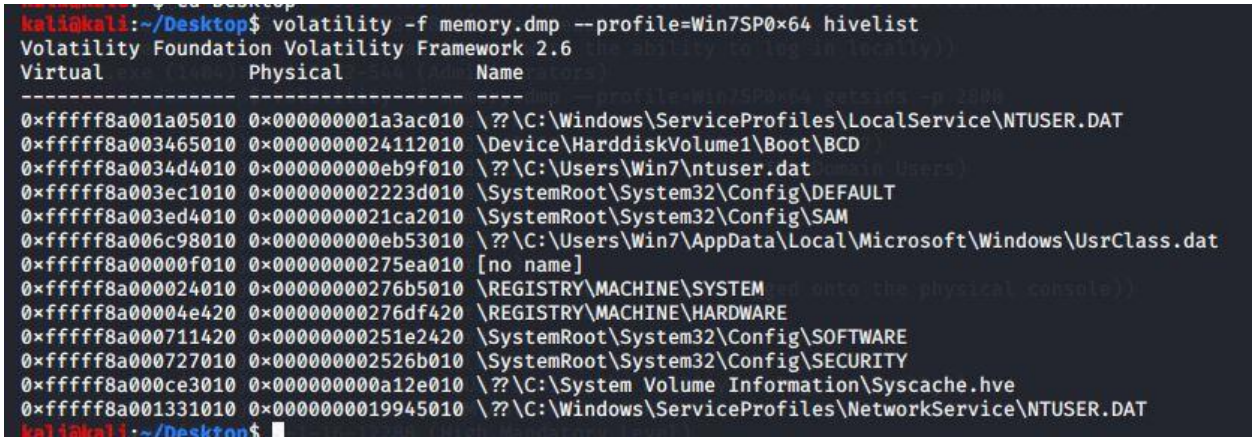
6.List available registry hives and identify a potentially malicious hive from the list. Explain and justify why such hive could potentially be malicious

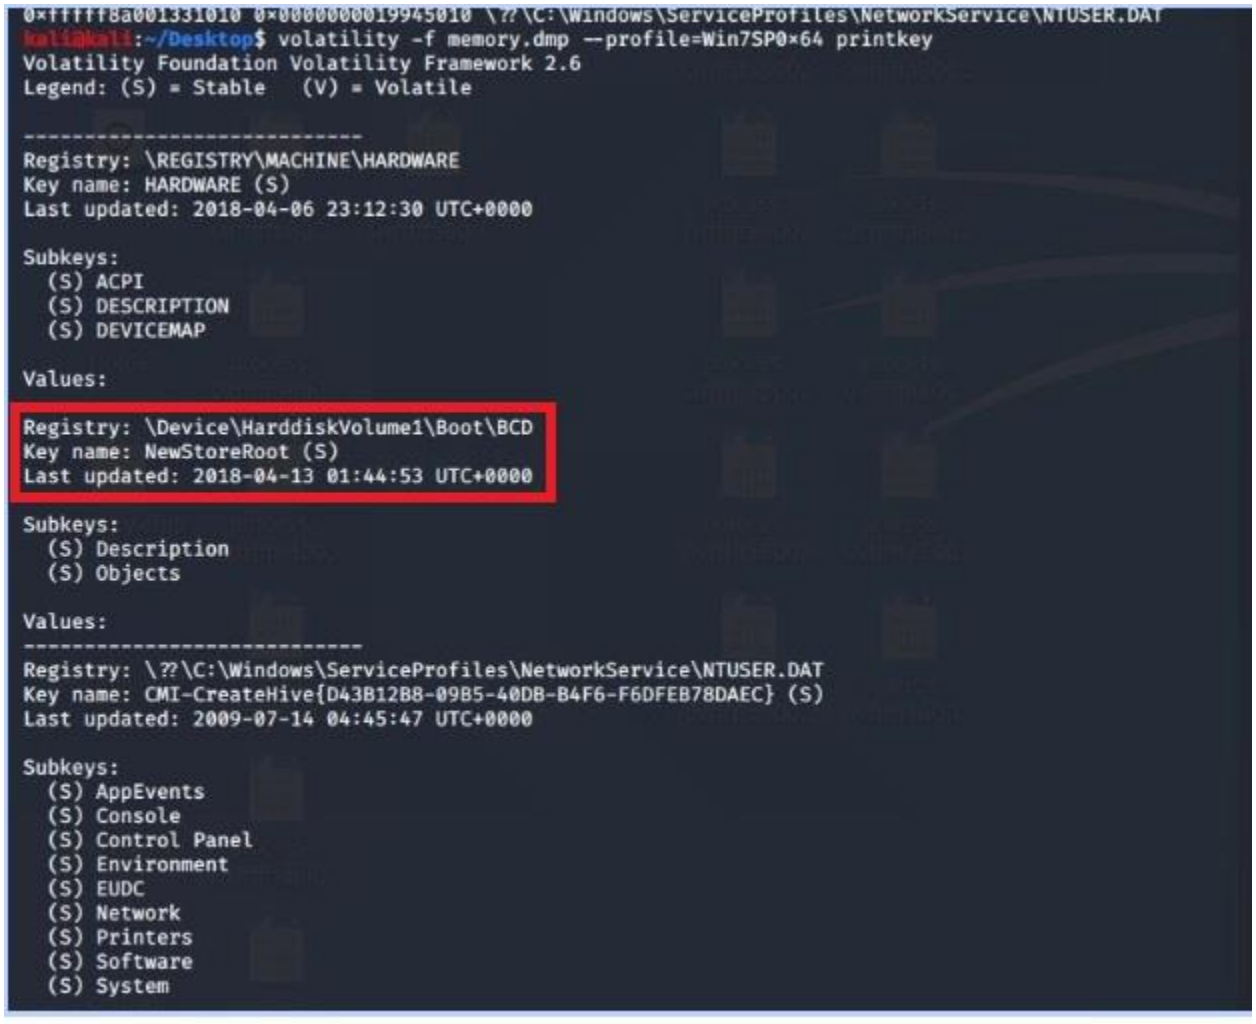
By using command as follow we see all registry hives:

Volatility -f memory.dmp –profile=Win7SP0x64 hivelist



For selecting which registry use to do more investigation we need more information about the time and keys,

Volatility -f memory.dmp –profile=Win7SP0x64 printkey



0×fffff8a001331010 0×0000000019945010 \??\C:\Windows\ServiceProfiles\NetworkService\NTUSER.DAT
kali@kali:~/Desktop$ volatility -f memory.dmp --profile=Win7SP0x64 printkey
Volatility Foundation Volatility Framework 2.6
Legend: (S) = Stable (V) = Volatile

  (S) Local Settings
```

When we reviewed these registries we see that \Device\HarddiskVolume1\Boot\BCD

Updated after start time of all of our suspicious process and also \SystemRoot\System32\Config\SECURITY updated after suspicious process 276,smss.exe and ??\C:\System Volume Information\Syscache.hve updated after suspicious process 1208 python.exe

To do more investigation related to subkeys and analysis in detail we are going under Software\Microsoft\Windows\Currentversio as follow:

University of Victoria

Volatility -f memory.dmp –profile=Win7SP0x64 printkey –K "Software\Microsoft\Windows\Currentversion"

```
kali@kali:~/Desktop$ volatility -f memory.dmp --profile=Win7SP0x64 printkey -K "Software\Microsoft\Windows\Current
Version"
Volatility Foundation Volatility Framework 2.6

```

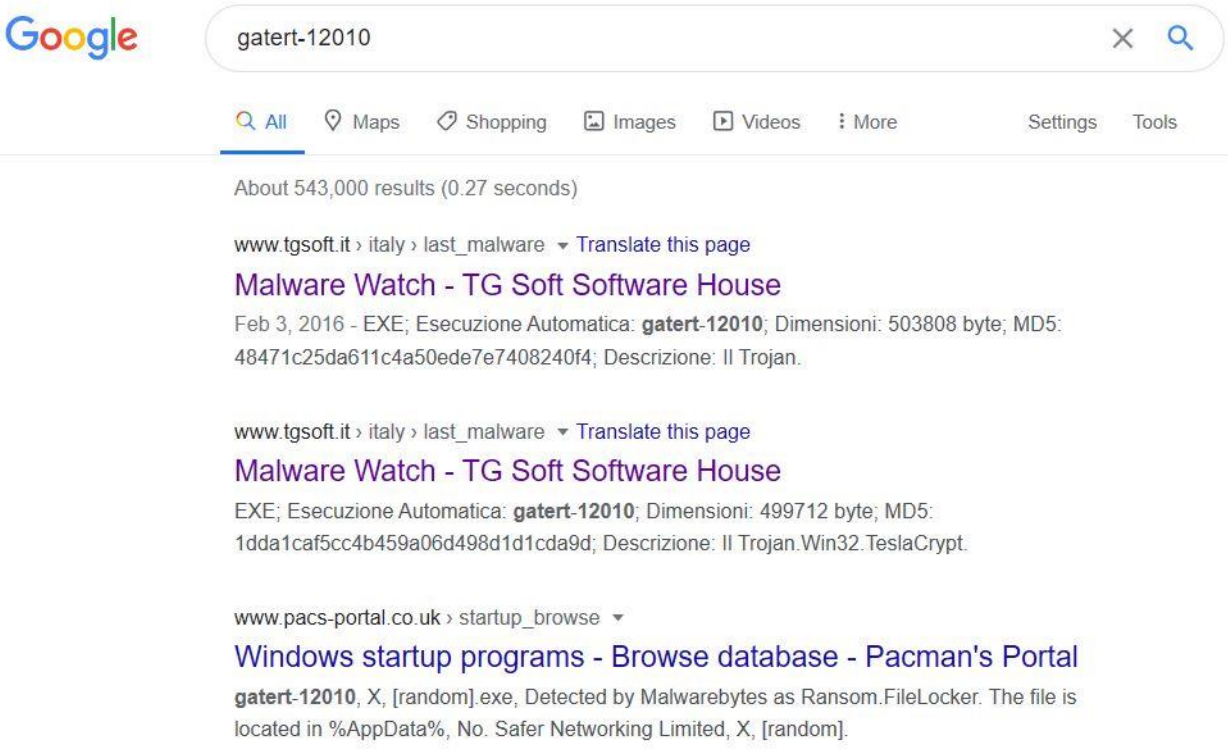
and when we google gatertt- 12010 we see its malicious as follow.

University of Victoria



University of Victoria

Scheda malware: Trojan.Win32.TeslaCrypt.AT

Nome: Trojan.Win32.TeslaCrypt.AT
Tipologia: Trojan

Data: 03/02/2016
Nome file: COMBFNF.EXE
Esecuzione Automatica: gatert-12010
Dimensioni: 499712 byte
MD5: 1dda1caf5cc4b459a06d498d1d1cda9d
Descrizione:
Il Trojan.Win32.TeslaCrypt.AT si copia in %USERPROFILE%\DATI APPLICAZIONI\COMBFNF.EXE
Modifica la seguente chiave di registro:
HKEY_CURRENT_USER\SOFTWARE\Microsoft\Windows\CurrentVersion\Run
[gatert-12010] = %USERPROFILE%\DATI APPLICAZIONI\COMBFNF.EXE
Note aggiuntive: Rimosso da **VirIT 8.1.3** e successivi.

Data: 03/02/2016
Nome file: BDJOSSG.EXE
Esecuzione Automatica: gatert-12010
Dimensioni: 491520 byte
MD5: a5e2a27e2b3c8956d28c82e5421a2a70
Descrizione:
Il Trojan.Win32.TeslaCrypt.AT si copia in %USERPROFILE%\APPDATA\ROAMING\BDJOSSG.EXE
Modifica la seguente chiave di registro:
HKEY_CURRENT_USER\SOFTWARE\Microsoft\Windows\CurrentVersion\Run
[gatert-12010] = %USERPROFILE%\APPDATA\ROAMING\BDJOSSG.EXE
Note aggiuntive: Rimosso da **VirIT 8.1.3** e successivi.

Data: 03/02/2016
Nome file: EDXDDFC.EXE
Esecuzione Automatica: gatert-12010
Dimensioni: 778240 byte
MD5: 5a5f609caa38746f47a0790fb9ca3aec
Descrizione:
Il Trojan.Win32.TeslaCrypt.AT si copia in %USERPROFILE%\APPDATA\ROAMING\EDXDDFC.EXE
Modifica la seguente chiave di registro:
HKEY_CURRENT_USER\SOFTWARE\Microsoft\Windows\CurrentVersion\Run
[gatert-12010] = %USERPROFILE%\APPDATA\ROAMING\EDXDDFC.EXE
Note aggiuntive: Rimosso da **VirIT 8.1.3** e successivi.
